# KOBELT DISC BRAKES

## GENERAL INFORMATION

Kobel Manufacturing has been designing and manufacturing disc brake systems for 50 years. We have gained an enviable reputation for cost-effective performance and reliability.

Kobel disc brakes are used in all corners of the world. The applications we serve are limitless. Sales and service are available from distributors throughout the world.

Most of our older brake calipers were manufactured in sand cast bronze. Increased demand prompted us to apply our extensive knowledge of bronze die-casting technology to a whole new series of brakes. Caliper models 5019-5030 are made entirely of die-cast silicon bronze with stainless steel hardware. While older models are still available upon special request, the new series is much more uniform in design and is also more cost-effective.

All our calipers are available in either fluid or spring applied configurations. Several types of brake linings are also available to conform with environmental guidelines.

## APPLICATIONS

- Aerospace
- Cable spooling reels
- Cable trams
- Chair lifts
- Conveyor belt systems
- Draw works disc brakes, both on land and off-shore
- Drill ship anchor handling
- Hoists
- Industrial equipment
- Logging and forestry
- Mining
- Paper industry
- Pipe laying barges
- Propellor shaft brakes, from 40 - 50,000 H.P.
- Railroad equipment
- Sugar industry
- Wind generators

## DISC BRAKE SELECTION

Selecting the proper brake disc and brake caliper is important and can only be accomplished if all the information pertaining to the operation of the braking system is made available to Kobelt Manufacturing.

When completing the application form, it is best to consider the most challenging operating conditions. If a brake runs 95% of the time on the light-duty cycle, and 5% on the heavy-duty cycle, it is the 5% that must be considered when selecting a braking system.

Disc brakes are used in innumerable types of applications. A static holding brake obviously requires very little consideration. Stopping brakes are relatively simple. Tensioning and cycling brakes can become very complex. We have in-house computer programs to assist our customers in selecting the proper combination of brake disc and brake caliper.

The information that we provide is reliable within 5%, and includes a 20% safety margin. If a brake disc, however, is poorly installed, no air circulation, overheating, disc failure and premature lining wear may result.

When installing a brake disc that is running at elevated temperatures, it is of extreme importance to allow for disc expansion and contraction in operation. Bolt holes for attaching a disc should be over-sized and spigot IDs must have clearance. Failing to leave allowance for disc expansion and contraction may result in early disc failure.

Contact Kobelt Manufacturing with the details of your specific application. Let us help you select the most suitable disc brake system to stop your machinery safely and effectively.

Kobelt is ISO 9001:2000 certified.

# GENERAL INFORMATION

A brake disc must have the ability to absorb and radiate the energy that is imposed on it without over heating. The brake caliper must also have sufficient lining area to absorb the energy without going beyond the Pressure Velocity Ratio. The PV ratio should never exceed 250,000; that is to say, pounds per square inch of lining pressure and feet per minute rubbing speed. No general rule can be given in this area since all the factors of a braking system must be considered before making a definite choice. Small brake shoes such as the 5019 and 5020 are not suited for continuous energy input unless, of course, the energy is very small. The table below shows the horsepower hour (H.P. hour) before brake lining replacement becomes necessary. In other words, a 5020 brake caliper

can absorb 1733 H.P. hour before brake lining replacement becomes necessary. If, however, the temperature exceeds 650°-700° F, the lining will disappear at a much faster rate. Looking at brake caliper 5026, you will note that 27,160 H.P. hour of energy input into the lining is available. Again, if elevated temperatures occur, lining wear will accelerate. It is, therefore, extremely important to first of all pick a disc that is capable of absorbing the energy, and a brake caliper having sufficient lining to give a reasonable service life for the brake lining.

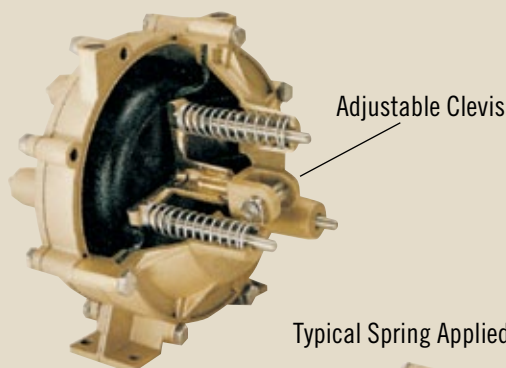

The disc thickness is also specified in the table below, as well as the minimum lining thickness before lining replacement should take place.

## CUSTOM ACTUATORS

Kobelco Manufacturing offers many actuators that can be fitted to various brake calipers. The standard actuators are basically all low pressure devices in either spring or fluid set. We make a large variety of actuators for high pressure fluid applied applications, as well as high and medium pressure spring applied actuators. If you have any specific requirements please let us know. Most of our calipers are also available in standard or side-mount version. Our Engineering Department will be pleased to come up with a solution to suit your application.

# KOBELT BRAKE CALIPERS

## WHY ARE KOBELT BRAKE CALIPERS THE BEST?

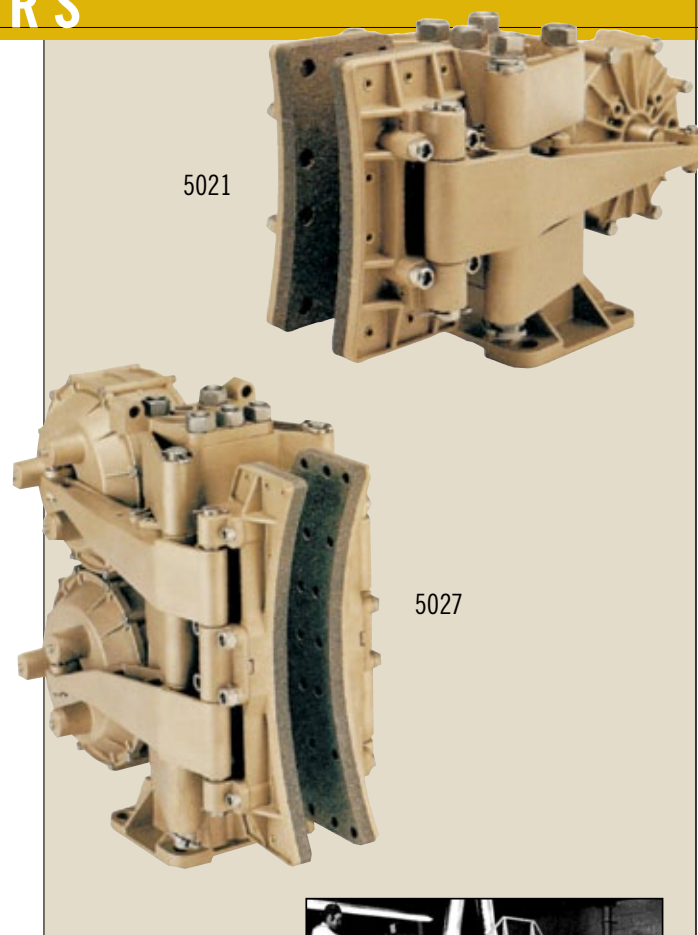

Kobelts calipers are designed for the harshest environments. Regular inspection and maintenance, however, are required as per our installation and maintenance instructions.

All calipers are lever operated, which keeps the actuator away from the heat of the disc. The actuators themselves are of the low pressure type, requiring maximum 100 P.S.I. (6.9 bar) for pressure applied brakes and maximum 140 P.S.I. (9.6 bar) fully released for spring applied calipers. Either air or hydraulic pressure can be used. For applications with high-pressure hydraulics, special actuators are available. All actuators have adjustable clevises to adjust the clearance between the disc and the shoe. This can compensate for brake lining wear as well as maintain the torque on spring applied calipers. On fluid applied brake calipers air consumption can be reduced by maintaining little clearance between the shoe and the disc.

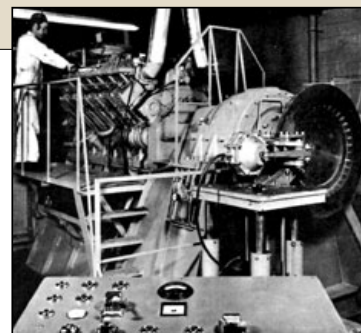

The pressure applied to the brake is absolutely proportional to the brake torque itself. Therefore, our actuators, both fluid and spring applied, lend themselves extremely well to applications requiring precise control over the brake torque. All brake calipers, except Model 1720 use floating brake shoes. A patented balancing link is utilized to keep the shoes parallel to the disc, which ensures even lining wear across the whole shoe. Spring applied calipers are furthermore equipped with an equalizing link. This linkage arrangement keeps the shoes centered in relation to the disc. This is useful, should the caliper be installed on a horizontally rotating disc where one of the brake shoes could cause drag. All of our calipers have a large shoe area, giving long lining life. The linings are asbestos-free.

Kobelts Manufacturing spends a tremendous amount of time designing new products, and we are committed to prototyping, cycle testing and stress analysis to ensure our products are dependable, durable and reliable in the field. Our competitors have tried to imitate our products, but the dependability of a Kobelt disc brake is unsurpassed.

Many years ago, Kobelt Manufacturing built 2 test stands for in-house testing of disc brakes. The 650 HP test unit provided us with invaluable information and gave us the opportunity to

observe every detail of disc brake performance under variable and extreme conditions. Information of this nature is not available in text books.

Over the years, our engineering department has been granted many patents which put these brakes in a class by themselves. Further patents are still pending, underlining our commitment to advance disc brake technology which benefits all users.

Kobelts disc brakes are manufactured under one or more of the following patent numbers. Further patents pending.

Canadian Patent Numbers		U.S. Patent Numbers	
895693		3722636	4164993
922603		3815471	4236608
1069066		4013148	4393962
1072025		4060153	4572335
1158181		4108285	7,857,109 B2
1176187		4121697	

Kobelt calipers are made entirely of die cast silicone bronze with stainless steel hardware. Some models have steel tie rods. The standard lining supplied is asbestos-free with a co-efficient of friction between .45 to .55. Patented balancing links are used to ensure even lining wear. All calipers are available with shims between the shoe and the bearing to adapt to thinner discs. Most of our actuators are of the low-pressure type. Air or hydraulic pressure can be used to either apply or release the brake. The pressure applied brakes have a maximum pressure of 100 P.S.I.

To fully release a spring applied brake is 140 P.S.I. For low pressure spring applied calipers the pressure range could be anywhere from 100 to 140 P.S.I. to fully release the brake. The maximum pressure in most cases will be 250 P.S.I. For high pressure spring applied calipers the release pressure could be anywhere from 1200 to 2000 P.S.I. depending on the model.

Remember to keep the clearance between shoes and disc at minimum for spring applied calipers.

If a quick or rapid response is required, one should select air for air applied and spring applied calipers. Large lines and valves are required for quick response.

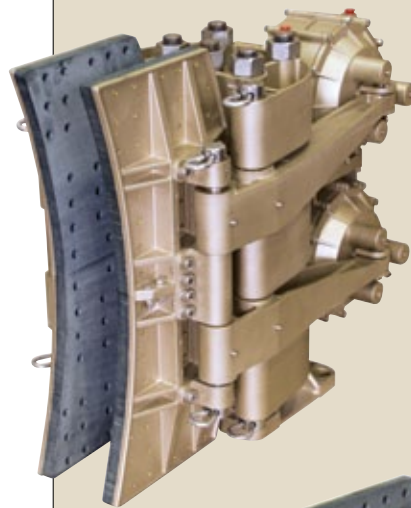

Over the last few months, our engineering department has developed a selection of new brake calipers and discs. The models 5029 and 5030 are die cast in bronze with stainless steel hardware except for the tie rods which are made out of 4140 steel. The models 5042 to 5049 mainframes and levers are made in ductile iron, whereas the actuators and shoes are made in bronze with stainless steel hardware and steel tie rods. The model 5049 has a maximum torque of 198,000 lbs — *see our tables for details*.

We have also applied for a patent for a new failsafe braking system, which does not incorporate springs. Further information on this will be available once the patent is granted.

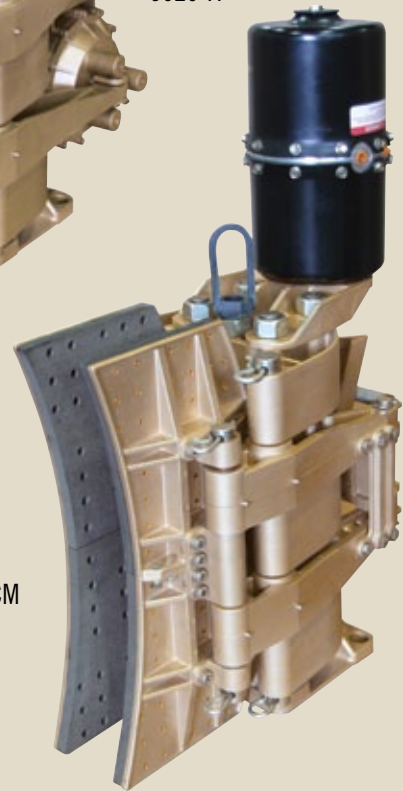

Kobelt Manufacturing Co. Ltd. is also developing direct-acting hydraulic brake calipers. Again, we have applied for a patent on this design and believe that it will be a great improvement over the present state of technology.

CONSULT KOBELT MANUFACTURING FOR MORE DETAILS.

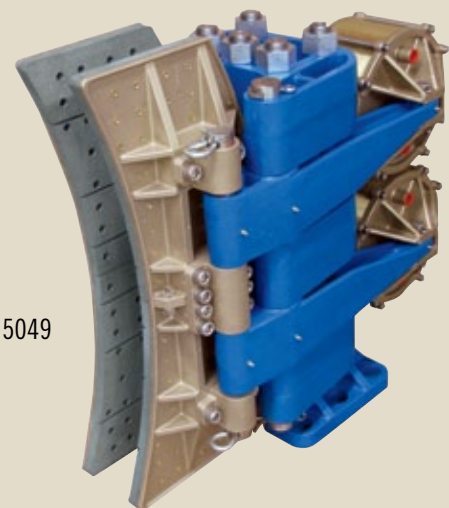

*Kobelt Manufacturing Co. Ltd. reserves the right to make any changes without notice.*

5029-A

5029-CM

5042 - 5049

# 5019-5028 DIE CAST BRAKE CALIPERS

All of the new brake models 5029 to 5049 are designed for a standard disc thickness of 4". All of these calipers are available with shim kits that allow shimming the caliper down to 3" and 2" thick discs.

For emergency brake applications, it is best to make the disc out of solid steel, since it is a better heat sink than a ventilated disc. A solid steel disc takes longer to cool, therefore, it is for emergency applications only. Solid steel discs can be made locally wherever the customer is located as the transportation costs could be quite high.

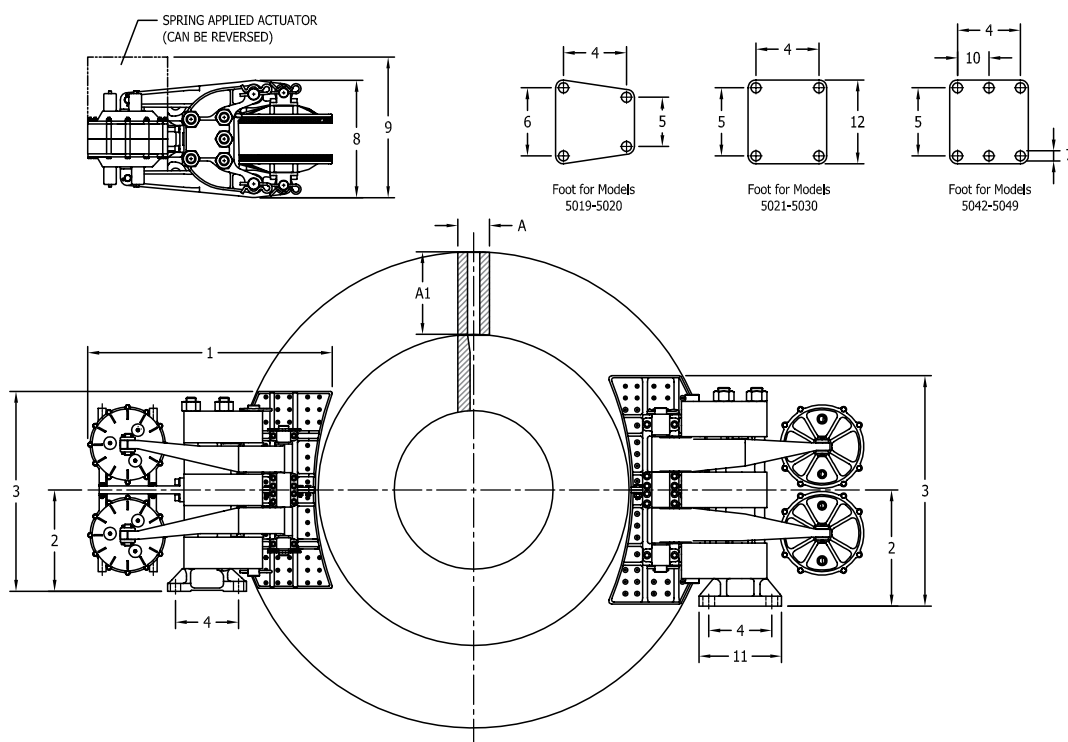

Figures in table at right refer to one brake per disc.

*More brakes per disc are available.*

\* Brakes 5022, 5026, 5027 and 5028 have alloy steel tie rods.

## THE ILLUSTRATION BELOW SHOWS A TYPICAL AIR APPLIED DISC BRAKE ARRANGEMENT.

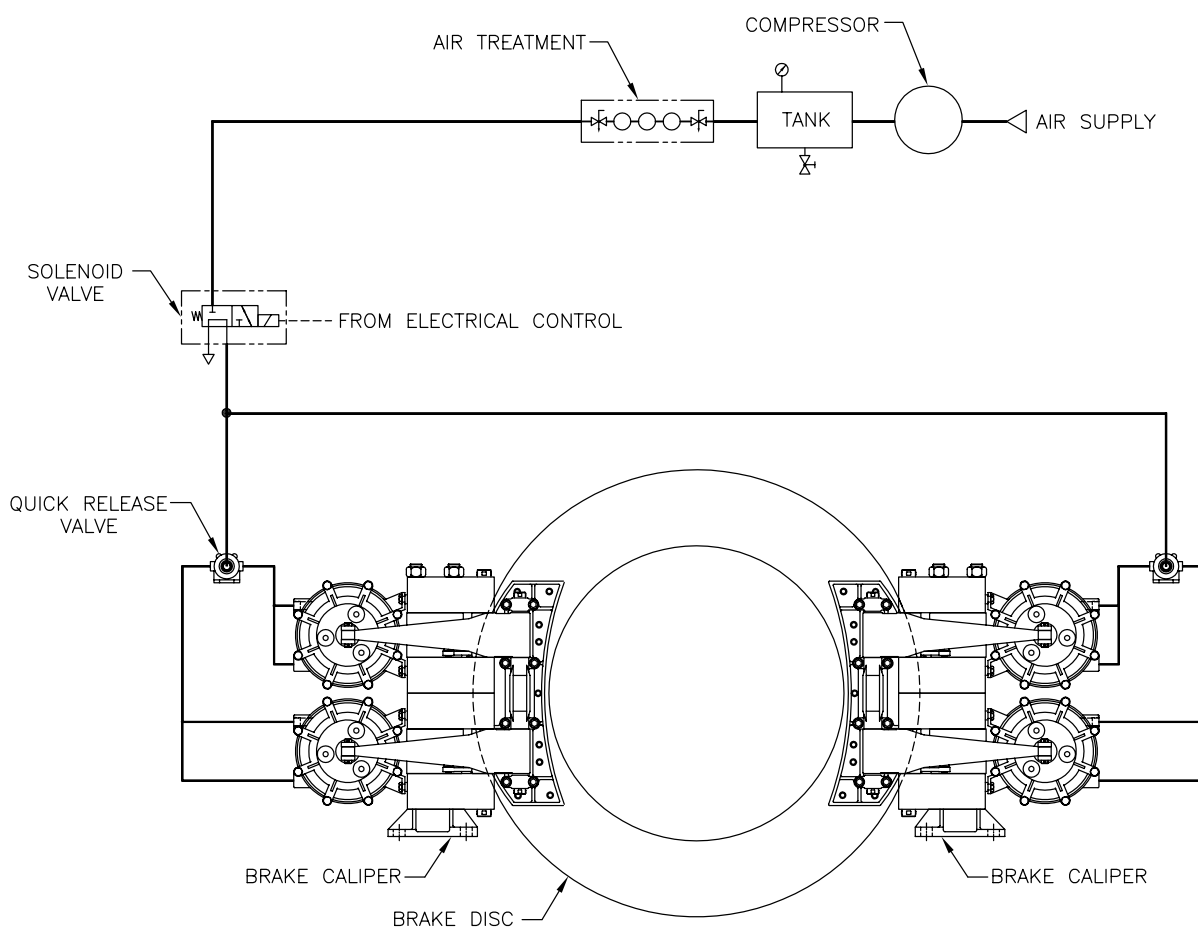

The 2nd caliper does not necessarily have to be installed, but in some cases it may be necessary in order to increase the torque. An air compressor of sufficient volume and storage tank are required.

The control valve can be either solenoid operated or simply a 3-way valve which could function as either an “on/off” or a variable pressure device, giving absolute complete control

over the brake functions. In some cases, the control valves do require lubrication to maintain accuracy and avoid sticking.

If a fast-acting response is required, one must install generous-sized valves and lines. In order to dump the air more rapidly, a quick release valve should be installed near the brake caliper. If the requirement is to apply the brake more slowly, a flow control can be installed in the pressure line.

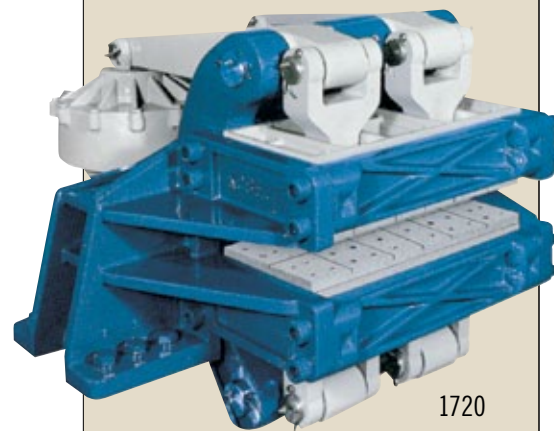

Diaphragm type brake actuators are extremely sensitive to air pressure changes and do not require lubrication.

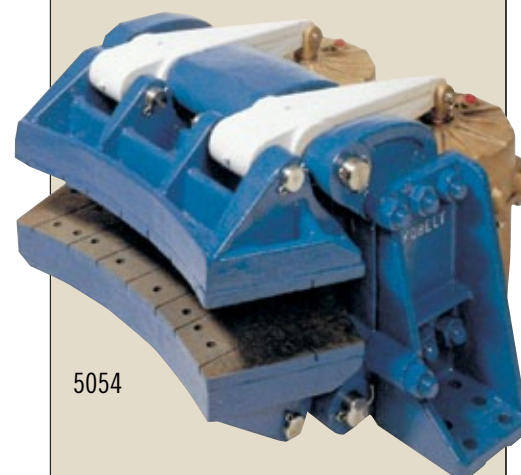

*Kobel Manufacturing Co. Ltd. reserves the right to make any changes without notice.*

# 1720/5054 SAND CAST HIGH ENERGY INPUT BRAKE CALIPERS

These calipers were designed for extremely high energy input applications. They have a large shoe area which gives them long brake lining life. The brake lining supplied with these calipers has a coefficient of friction between .45 to .55. These calipers are available pressure or spring applied. Air or hydraulic pressure can be used to either apply or release the brake. The maximum pressure for pressure applied models is 100 P.S.I. (6.9 bar) and 140 P.S.I. (17 bar) for spring applied brakes. The torque ratings are the same for either version.

# MEDIUM AND HEAVY DUTY BRAKE DISCS

These brake discs were designed to go with our die cast brake calipers. They are suitable for both fluid applied and spring applied brakes. All discs are ventilated and can be used for medium to heavy-duty applications. Normally, they are cast in ductile iron, however, other materials are available to suit customer requirements.

# BRAKE DISC DETAILS FOR HIGH ENERGY INPUT

These brake discs were developed for medium to high energy input. The patented fin design offers the ultimate in heat transfer and air flow. This disc will accomplish tasks not possible with ordinary ventilated discs.

**4" SERIES BRAKE DISCS**

# DRAW WORKS DISC BRAKES AND BRAKE POTS

## AIR SUPPLY AND TREATMENT OF DRAW WORKS DISC BRAKES

It is of extreme importance that air compressors and storage tanks provide sufficient air during the operation of the brakes and clutches. There must not be any shortage of supply air. It is also equally important that all the air lines between the tanks, control valves and brake actuators are of a generous size. An operator will lose confidence in the rig if the brake response from the control handle is not instant. Actuators and control valves equipped with 'U' cups and 'O' rings require lubrication in order to provide years of trouble-free service. 'O' rings and 'U' cups will become sticky and show wear if not lubricated properly. Diaphragm type actuators do not require lubrication, however, it is recommended that the control valve have a lubricant in order to make it respond accurately.

The main supply line to the control and brake system should be equipped with a filter and regulator. The filter's responsibility is to remove moisture and dirt in the system, and the regulator will provide a constant air pressure to the control system. It is, therefore, important that the compressor pressure be set higher than the air pressure regulator. The oil that is required for the lubricator should be of a hydraulic type with a viscosity of 10 - 32. Heavy oils are not a good solution for lubricators. If the draw works is operating in a cold environment, it is recommended to have an air dryer in the system to remove all moisture. In some cases, in extremely cold locations, it may be necessary to add a lubricator large enough to handle all the air flow. This lubricator should be equipped with a metal bowl and can be filled with methyl hydrate wood alcohol. The wood alcohol must be used sparingly since it is not friendly to most synthetic rubber.

## BRAKE POTS

Kobelt Manufacturing provides three different types of actuators for the disc brake. The most common would be an air only applied actuator which is of a dual diaphragm type and does not require lubricating. These diaphragms provide an optimum accurate and controlled response.

Kobelt Manufacturing also produces a spring applied actuator which is of a piston type, and is equipped with multi spring packs which can be adjusted to suit customer

requirements. This actuator, however, requires lubricating in order to prolong the seal life and its accuracy. It is not as responsive as a diaphragm type.

The third actuator that Kobelt provides is of a truck type called Maxi Brake. This actuator is not manufactured by Kobelt and is of a dual diaphragm type whereby one diaphragm looks after the spring applied portion and the other diaphragm looks after the air applied portion. This combination comes in extremely handy when spring and air applied systems are both required. In order to release the spring brake, air must be accumulated in the spring chamber to compress the spring and release the brake. Now, the air applied portion will provide infinite control over the brake. The more air pressure that is accumulated in this chamber, the more torque the brake will produce. It is, however, very important not to apply the spring portion and air portion at the same time. This could cause an overload on the basic mechanical brake structure.

The Maxi Pot brake actuators are also equipped with a manual release screw whereby the spring portion can be manually released. It is critical that the air be applied to the spring portion so that the threads do not become over stressed when using the manual release screw, because in some actuators the thread screw is not designed to release the actuators without the assistance of air. The spring applied portion is only 60%.

## PLEASE NOTE:

If a customer fails to inform Kobelt Manufacturing of any specific characteristics of the machinery on which our brake assemblies are installed, which could be detrimental to the performance of our brakes, Kobelt Manufacturing will not assume any responsibility. This applies especially to machinery having harmonics, vibrations and crucial rpms since this may adversely affect the performance of our brake disc and caliper.

Upon ordering, please specify all operational details to ensure that you purchase the correct braking system for your individual application. Our representatives are happy to assist you with any questions that you may have, and will guide you towards the right selection for your needs. Furthermore, if our installation and maintenance instructions are not followed the warranties are also void.

# PNEUMATIC CONTROLS

Kobelt pneumatic controls are the finest in the industry. We manufacture all components for any type of pneumatic control system.

This control system features a limitless number of control stations. Additional control stations do not affect the performance of the control system. This means that, regardless of the distance or the force required, the control heads move effortlessly.

The pneumatic control system is one of the most flexible systems we offer. Since the system does not depend on the force you apply – everything is done by air signals – we can automate and synchronize as much, or as little, of your propulsion equipment as desired. The control options are almost limitless. We offer propulsion timing packages with, and without, shaft brakes. A timing system will protect your propulsion equipment. It ensures that the gear box is engaged before you accelerate your engine. The system will allow you to go from full ahead to full astern without damaging your gear box or stalling your engine.

You will find that the pneumatic system is best suited for vessels anywhere between 50 to 600 feet (15 to 180m). For the ultimate in styling, flexibility and for fingertip control, contact your nearest Kobelt distributor about Kobelt pneumatic controls.

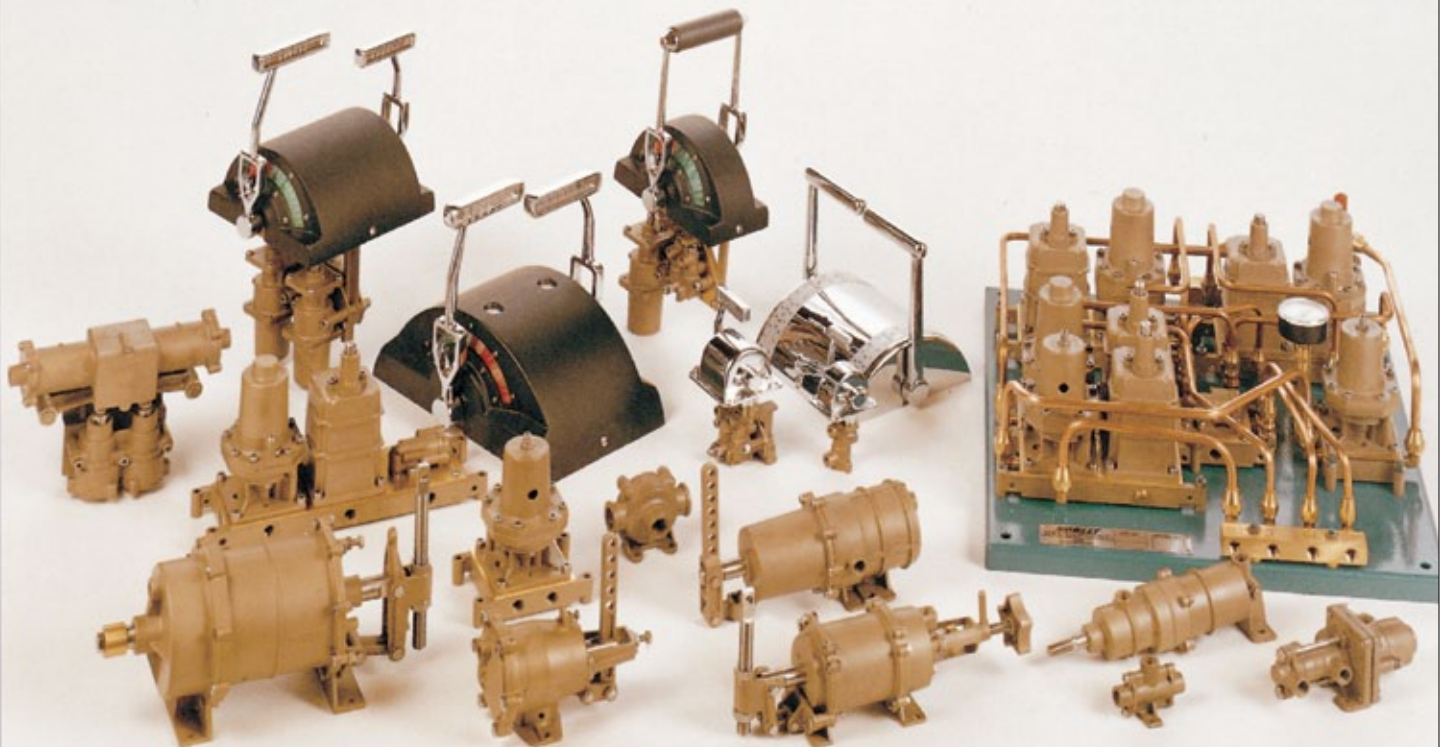

Kobelt's pneumatic controls are manufactured under one or more of the following patent numbers. Further patents pending.

# WE ALSO MAKE...

## PUSH-PULL CONTROLS

Kobelt provides a complete line of mechanical controls, all in die-cast bronze and stainless steel including push/pull controls for single- and multi-station applications. We generally do not recommend the installation of more than two stations with push-pull cables, and this system is dependent largely upon the quality of the cable and the layout of the installation. The mechanical push-pull control is a very simple and easily installed system designed for smaller boats. The equipment controlled by a system of this type must be relatively easy to operate. As a mechanically connected system, push/pull controls use cables to connect control heads to the clutch and throttle. If the total length of cable is less than 50 feet, with minimal bends 15 meters, a push/pull system can work well for you.

## HYDRAULIC STEERING

Kobelt specializes in hydraulic and electro-hydraulic steering systems, including the following integrated systems – manual hydraulic, electric power, power assisted and electronic steering.

The manual hydraulic system works entirely “by hand”, is simple and easy to install, and produces a smooth, simple method for steering. Electric power steering is driven by an electric power pack activated by a jog lever which forces hydraulic oil to the cylinder. The full hydraulic power assisted system operates with a power-assisted cylinder, is very compact and low maintenance, with very few and easy steering wheel turns to hard over. Powered completely by an electronic control system, the electronic system is perfect for large vessels with multiple control stations, offering unlimited options with faster reaction time for steering gear.

In addition to these, hybrid or combined systems are also available. All systems are flexible, cost-efficient and easily integrated into other steering configurations.

## ELECTRONIC CONTROLS

Kobelt offers electronic control systems and individual components to suit all applications. Whether you require a simple or complex system, single or multiple stations, we offer a wide range of control heads, bases, microprocessors, actuators and accessories. We are also able to offer customized solutions to fit your vessel's specific needs. All Kobelt control components are made of bronze and stainless steel to ensure many years of corrosion-free operation. Clean 12 or 24 volt power is required along with sufficient amperage and voltage. A single cable connects the control heads and the CPU.

We offer three major systems to meet your needs. The simplest, best value is the Mighty Mariner. For more complex systems we offer the 6525 system. If you have a 360° system right-angle drive or Z-drive contact us for details about the 6535 system.

*Kobelt Manufacturing, Surrey, British Columbia, Canada*

**E**ver since our humble beginnings in 1962, Kobelt Manufacturing Limited has been committed to manufacturing the finest marine controls in the world. We stress the importance of quality, precision, competitive pricing and prompt delivery. Our team of dedicated production staff is uncompromising in ensuring that we meet the needs of all our valued customers. Our growing reputation in world markets is proof of our commitment to highest possible standards. From our very first line of pneumatic controls we've believed in the simple things—rugged construction, quality materials and prompt delivery to our customers. Today, the technology has changed, but our commitment remains the same. From our innovations in design and performance to our craftsmanship with bronze and stainless steel, our products span the world to further our reputation as an international leader in industrial and maritime technology.

Due to the nature of braking systems, our brake products come with a 1-year limited warranty, with the exception of brake lining for which there is no warranty. The warranty period for products from another manufacturer, components or in whole, will not exceed the terms or conditions under which their warranty was originally extended to Kobelt.
